A, Bescription: Primary structure of the herpesvirus saimiri genome.

A, Reference number: A36806

A, Molecule type: DNA

A, Residues: 1-303 (ALB)

A, Cross-references: GB: X64346; NID:g60320; PIDN:CAA45644.1; PID:g60342

A, Cross-references: GB: X647-508; 1992

A, Title: Primary Structure of the herpesvirus saimiri genome.

A, Reference number: A37309; MUID:92333688; PMID:1321287

A, Roterints: annotation; possible protein-coding frames

A, Note: neither amino acid nor nucleotide sequence is given

J. Invest. Dermatol. 122:147-158(2004).

-! FUNCTION: In the hair cortex, hair keratin intermediate filaments are embedded in an interfilamentious matrix, consisting of hair keratin-associated protein (KRTAP), which are essential for the formation of a rigid and resistent hair shaft through their extensive disulfide bond cross-linking with abundant cysteine residues of hair keratins. The matrix proteins include the high-sulfur and high-galycine-tyrosine keratins.
-!- SUBUNIT: Interacts with hair Keratins.
-!- TISSUE SPECIFICITY: Restricted to hair root, not detected in any

J. Invest. Dermatol. 122:147-158 (2004).

-! FUNCTION: In the hair cortex, hair keratin intermediate filaments are embedded in an interfilamentous matrix, consisting of hair keratin-associated protein (KRTAP), which are essential for the formation of a rigid and resistant hair shaft through their extensive disulfide bond cross-linking with abundant cysteine residues of hair keratins. The matrix proteins include the high-sulfur and high-galycine-tyrosine keratins.
-!- SUBUNIT: Interacts with hair keratins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Schweizer J.;

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

                                                                                                                                                                                                                                                                                                                                                                                      AAU04530 standard; peptide; 7 AA
```

Example 1; SEQ ID NO 23757; 1069pp; English.

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive trauma, peptides are also used to modulate vascular permeability equelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability or brain. The peptides are used to includes, peritoneal cavity, pleura, or brain. The peptides are used to incepted a lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteonwelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention olypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies may also be used to downregulate expression and activity of P. acnes polypeptides and chertore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by chargonestic agents for determining P. acnes presence, for example, by this patent did not form part of the printed specification, but was the contactine in the sequence data for the printed specification, but was the contactine of the printed specification of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                        Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The polypeptides encoded by the polymucleotides (BAM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polypeptides of the invention. The invention is an expectation of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; an method for stimulating an immune response specific for a P. acnes polypeptide and an isolated r cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymetleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polypeptides, polymeleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymelosism, and method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymeleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymelian or antigen-presenting cells that express the polymelian or antigen-presenting or treating acnes to protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the simulating an immune response spelyment or acnes, can immune response against P. acnes, or for treating acnes to protein and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open canding frame) contained within the P. acnes polymelecticies of the cinvention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.whpo.int/published_pot_escondance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recardion (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in disorders conditions and to produce other types of data and products dependent on DNA and and can of sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the partner specification, but was obtained in electronic format directly from WIPO at Electronic format directly from WIPO at

(HUMA-) HUMAN GENOME

Ruben SM

Barash SC,

Rosen CA,

WPI; 2001-541565/60. N-PSDB; ABA12368.

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Claim 11; SEQ ID NO 4699; 1701pp + Sequence Listing; English

The invention relates to novel genes (ABAll004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow,

breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
   New protein complexes comprising BTC and a second protein (e.g. mLOC243548, mDLK1 or mPACE4) useful for diagnosing, preventing or treating disorders such as diabetes mellitus, nephropathy, cardiovascular
  The invention relates to an isolated protein complex having a first protein which is betacellulin (BTC) or its homologue, derivative or fragment, interacting with a second protein selected from mLOC243548, mDLK1, mRACE4, mBC032073(1598), mTHBS2, mFBLNS, mAK009011, mHRMTLL2, mMATN3, mN1D1, mTASP(459), mINPPSB, mTAKEDA008, UBB, mTREXI, mSGT and CAMLG, or homologue, derivative or fragment. A complex of the invention has antidiabetic, antilipemic, antiarteriosclerotic, nephrotropic,

   Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and obte SAPHO syndrome (synovitis, acne, P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaries. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Entercoccus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.

The invention transes to an isolated privation of the forest of the invention also relates to conciding a Propionibacterium acres protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of F. acres polypeptides. The invention and the invention and host cells comprising a polypeptide of the invention; and the invention, antibodies against polypeptides of the invention; this on proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acres polypeptide and an isolated T cell population comprising T cells prepared polypeptide and an isolated T cell population. T cell populations, or antigen-presenting cells that express the polypeptide; a method and kit conditions and a method for inhibiting the development of P. acres in a patient; and a method for inhibiting the development of P. acres in a patient. The P. acres polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acres collypeptides are useful for diagnosing, preventing or treating acres collypeptides are useful for diagnosing, preventing or treating acres protein. The polymucleotides can also be used as probes or primers for

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primeras, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders conviving abbrrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
  ö
              stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polynucleotides of the invention. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

ö
  The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the

3: pir3:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A Godowski P., Gray A.;
The secreted protein discovery initiative (SPDI), a large-scale
T effort to identify novel human secreted and transmembrane proteins: a
   TISSUE SPECIFICITY: Weakly expressed in most tissues, except in brain. Expressed at intermediate level in brain, including brain. Expressed at intermediate level in brain, including cerebellum, substantia nigra, hippocampus and fetal brain. DISBASE: Defects in CSMD1 may be a cause of oral and oropharyngeal squamous cell carcinomas (OSCCS). Ref.5 and Ref.6 are however in disagreement: while Ref.6 considers CSMD1 as a strong candidate for OSCCs, Ref.5 thinks it is not.
SIMILARITY: Contains 14 CUB domains.
SIMILARITY: Contains 28 Sushi (CCP/SCR) domains.

-!-FUNCTION: Catalayzes the formation of S-adenosylmethionine from methionine and ATP (By similarity).

-!-CATALYTIC ACTIVITY: ATP + L-methionine + H(2)O = phosphate + diphosphate + S-adenosyl-L-methionine.

-!- COPACTOR: Binds 2 divalent ions, such as magnesium or cobalt, and 1 potasstum ion per subunit (By similarity).

-!- PATHWAY: Activated methyl cycle.

-!- SIMILARITY: Balongs to the AdoNet synthetase family.

  The sequence is a Human Immunoglobulin superfamily, IgSF, protein, a diverse family of proteins involved in cell-cell interactions, cell-surface recognition, intercellular communication and immune and inflammatory responses. Polypeptides and antibodies directed to polypeptides of the present invention are useful to provide immunological probes for differential identification of tissues. Antibodies can be used to assay levels of polypeptides encoded by polymucleotides of the invention. Polypeptides of the present invention can be used to treat or prevent diseases or conditions such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders, pulmonary disorders, and/or cancerous diseases and conditions. Polymucleotides of the invention are also useful in treating the above disorders include common variable.

 The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, mootropic, anoretic, antidiabetic, nd antibody are useful in the antidiabetic polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polypucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence
   ö
   New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, antoidabetic, antidiabetic, and an antidiabetic and antidiabetic antidiabetic polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polypucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are turbing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence
   New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 50-52; 141pp; English.

This sequence is the NoV16 protein. The invention relates to the NoV1NOV16 proteins, and their coding sequences. The proteins have Cytostatic;
Contraceptive, antihifalmmatory; immunomodulatory; and cardiovascular
activities. The sequences may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate NoVX expression. They
crectifying mutations or deletions in a patient's genome that affect the
activity of protein by expressing inactive proteins or to supplement the
crectifying mutations of protein. They are used to produce NoVX
proteins, by inserting the nucleic acid into a cell and culturing it to
express the protein. The DNA may be used as DNA probes in assays to
crectifying mutatione the presence of similar DNAs in samples, and which
contriby of production of protein. They are used to produce NoVX
proteins, by inserting the nucleic acid into a cell and culturing it to
express that may be used as DNA probes in assays to
creativity in the production of antibodies (Abs) against NoVX and in
cas antigens in the production of antibodies (Abs) against NoVX and in
cas antigens in the production of antibodies (Abs) against NoVX and in
contriby. The anti-NoVX Abs are used for detecting the presence of NoVX
crivity. The anti-NoVX Abs are used for detecting the presence of NoVX
crivity. The anti-NoVX Abs are used for detecting the presence of NoVX
crivity. The anti-NoVX Abs are used for detecting the detectistic of
contraception).

proteins, by inserting the nucleic acid into a cell and culturing it to express the protein. The DNA may be used as DNA probes in assays to detect and quantitate the presence of similar DNAs in samples, and which patients may need restorative therapy. The NOVX protein may also be used assays to identify medulators of NOVX expression and activity. The anti-NOVX Abs are used for detecting the presence of NOVX activity. The anti-NOVX Abs are used for detecting the presence of NOVX ary depending on the NOVX protein. NOV1, NOV3, NOV9-11 and NOVI-16 have casein kinase II phosphorylation sites characteristic of serine/threonine kinases, and are used to treat kinase-related disorders (e.g. Peutz-Jeghers syndrome, cellular proliferation and contraception). NOV2-3, NOV6 and NOV8 are homologous to the epidermal growth factor (EGF) (e.g. Peutz-Jeghers syndrome, cellular proliferation and contraception). NOV2-3, NOV6 and NOV8 are homologous to the epidermal growth factor (EGF) (e.g. Peutz-Jeghers syndrome, cellular dont migration, cell structure and motility and protein management, and are used to treat cancers, inflammatory disorders, immune disorders and cellular adhesion disorders inflammatory disorders, immune disorders and cellular adhesion disorders. NoV6-10 are homologous to EGF-like fibrillin proteins and are used to treat cancers, syndrome and marfan syndrome

polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and any have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.
   New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.
  Human, C3b/C4b complement receptor-like molecule; immune system disorder; gene therapy; rheumatoid arthritis; psoriatic arthritis; osteoarthritis; inflammatory sithatis; inflammatory joint disease; Alzheimer's disease; multiple sclerosis; inflammatory bowel disease; nervous system disorder; transplant rejection; autoimmune disease; ischaemic condition; nootropic; metabolic disorder; immunomodulatory; neuroprotective; diabetes; lupus; infertility; vasodilator; obesity; cardiant.

The invention relates to a nucleic acid encoding a novel C3b/C4b complement receptor (CR)-like nucleic acid molecule. The C3b/C4b CR-like polypeptide and nucleic acid molecules may be used to treat, prevent, ameliorate, diagnose and/or detect diseases such as immune system disorders such as rheumatoid arthritis, psoriatic arthritis, inflammatory intringis, osteoarthritis, inflammatory joint disease, autoimmune transplant rejection, nervous system disorders (e.g. Alzheimer's disease, ischaemic conditions, metabolic disorders (e.g. Alzheimer's disease), ischaemic conditions, metabolic disorders (e.g. obesity and diabetes) and infertility. The invention is useful in gene therapy. The present sequence is human C3b/C4b complement receptor like protein, alternative version. Note: The present sequence is stated to be the same as that referred to as SEQ 10 NO:2 (AABZ07087) shown in figure 1 of the specification. However the sequences differ at position 695

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Description

Human rep Human tes

WPI; 2001-442248/47.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet a carbon separation distances on opposite antiparallel strands of a

characterised by anglogenesis, neovascularisation or lymphanglogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangloma, vascularised malignant or benign tumour, post-recovery chemangloma, vascularised malignant or benign tumour, post-recovery trauma, substance-induced neovascularisation of the liver, excessive normone-related anglogenic dysfunction, diabetes induced neovascular caquelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to inage blood vessels and lymphatic with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
  ö
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with a least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, necovascularisation or lymphanglogenesis in a mammal with a condition
  Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the
  Nucleic acids encoding 973 human testicular antigen polypeptides, useful for preventing, diagnosing and/or treating testicular cancer.

  Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
   The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention

   The present invention describes DNAs encoding hair keratin-associated proteins (KAP) of human origin, which bind to hair keratin. Also the described: (1) DNA encoding KAPs of mouse origin; (2) proteins encoded by the human and mouse DNA, and their partial peptides, and proteins derived from them by addition, deletion and/or substitution of one or more amino acid residues; (3) DNA hybridising to the DNA encoding KAP; (4) peptides SCCKPSCCXP (1), where X = Q, V, R or I, and YGXGYGSGY (II), where X = Y, L or F; (5) fusion proteins and peptides containing these proteins and proteins and proteins and proteins and proteins and proteins and proteins and proteins and peptides (6) antibodies to the proteins and peptides (7) recombinant proteins and peptides (8) expression vectors containing the DNA encoding KAP; (9) host cells transformed by these vectors; (10) non-human animals which
human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the
  DNAs encoding 39 Keratin-associated proteins localized on human chromosome 21, useful for screening binding and expression modifiers and as cosmetic and therapeutic agents for hair disorders.
  are knockout animals for KPD or which overexpress KAP; (11) screening substances promoting or inhibiting the binding of KAP to hair keratin, promoting or inhibiting the expression of KAP, comprising using KAP or their partial peptides or cells expressing them; (12) compounds identified by the screening method; and (13) tolletry and therapeutic compositions containing these compounds, or containing KAP or their

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therepy of pathological conditions, as molecular traspets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P aeruginosa nucleic acid, as components of effective antibacterial targets, as tamplates for recombinant including anti-p. aeruginosa-derived peptides or polypeptides, as including anti-p. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO8436 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed

partial peptides or (I) or (II), expression vectors for them, or host cells transformed by these vectors. KAP sequences can be used as hair growth promoters. The KAPs are useful as active ingredients in toiletry compositions (such as hair and beard growth improvers, hair colourants and hair conditioners) and in therapeutic compositions for hair disorders. The present sequence is used in the exemplification of the present invention.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human configuration relates to a method of producing a monomeric monocyclic peptide by a measuring betanethed of producing a monomeric monocyclic peptide by a measuring betanether carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior corpitation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC cordition is diabete interfere with angiogenesis.

CR che condition is diabete in extinopathy, periasks, arthropathy, cerebrovascular accident, post-arisation or lymphangiogenesis.

CC tramma, substance-induced neovascularisation of the liver, excessive condition; is diabete in a mammal with a condition is diabeted malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold tramma, substance-induced neovascularisation of the liver, excessive communiation. The peptides are also used to modulate vascular permeability in accumulation in peripheral limps or in lungs, peritoneal cavity, pleura, cacumulation in peripheral limps or in lungs, peritoneal cavity, pleura, corbinature. The monomeric and bicyclic peptides are also used in combination with an anti-inflammatory agent, to treat a corrion related artinor with an anti-inflammatory agent, to treat a corrion related and incompanially rheumatoid arthritis, psoriasis and diabetic relational activity induced by VEGF. Cr or D and diabetic relational parts and province are also used in combination with an anti-inflammatory agent, to treat a corporation inflammation with an anti-inflammatory agent, to treat a corporation of the peritone biological activity induced measured to indepted and and activity induced are use
   Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

the epoxidation of alkenes. The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORFs amoA and amoC encode subunits 1 and 2 of the alkene monoxygenase enzyme and ORF amoD encodes a reductase capable of transferring electrons from NADH coenzyme to a monoxygenase. (Updated on 16-OCT-2003 to standardise OS field)
  Alkene mon:oxygenase and corresp. gene - useful for the epoxidation of an
  AAR81469-R81472 are protein products of the Nocardia corallina strain B-276 alkene mono-oxygenase gene. The gene encodes 4 protein products amoA, amoB, amoC and amoD derived from the 3 different reading frames of the operon. The gene is useful for the production of indigo via oxidation of indole. Nocardia corallina can be cultured in a medium contg. indole and will readily oxidise the indole yielding indigo into the culture medium. E. coli may also be transformed with the alkene mono-oxygenase gene and used as above to efficiently produce indigo by microbial oxidation. (Updated on 16-OCT-2003 to standardise OS field)
  E.coli transformed with the DNA sequence AAQ79569 are able to catalyse
   Prepn. of indigo by a microbiological method - by culturing a microbe having alkene monoxigenase activity to oxidise indole to indigo.

  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGED (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
   Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGT) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed carivity of (II) as useful in gene therapy techniques to restore normal carivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
  ö
The invention relates to novel foetal polypeptides encoded by polymucleotides comprising one of 477 sequences fully defined in the specification. The foetal polymucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a cDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries

The invention relates to a rat cubilin protein. Cubilin is a ligand-binding, epithelial glycoprotein receptor that facilitates uptake of intrinsic factor/viranin B12 complexes in intestines and kidney. It is also involved in endocytosis and trafficking of light immunoglobulin chains in renal proximal tubule cells. Host cells containing a vector comprising the rat cubilin DNA sequence can be used for the recombinant expression of the protein. Cubilin, or its fragments, are used to treat or reduce toxicity, particularly in kidneys, spleen, brain, liver, heart and thyroid. Cubulin mutations may also be implicated in idiopathic proteinuria, fetal malformation, poor fetal development and spontaneous abortions. Cubilin may also be used to raise specific antibodies, used for its detection, or clones that express it, in standard immunoassays. Fragments of cubilin DNA can also be used to detect cubulin mRNA in cell and tissues, by hybridization. Abnormal levels of cubilin in the urine are indicative of kidney damage. Sequences ANY27021-35 represent EGF repeated from thomologous regions of other

   The invention relates to the entire genome of cyanophage S-2L, and to the protein encoded by it. Genes isolated from the genome of S-2L are useful for preparing enzymes for synthesis of D-bases (D = 2,6-diaminopurine), particularly D, dDMP and dDTP, or polymucleotides containing these bases, polymerases involved in metabolism of D-bases and deoxynucleotide analogs, for chemcherapy of AIDS. The genes, and encoded polypeptides, can be used for detection and/or identification of S-2L, and for identifying agents that modulate synthesis of D-bases or polymucleotides containing them, and fusions of S-2L polypeptides with an antigen can be used to raise specific antibodies, useful for detecting S-2L. This
